802.11n 3G Router with USB2.0 Port

User's Manual

Federal Communication Commission

Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications.

However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- **Reorient or relocate the receiving antenna.**
- □ Increase the separation between the equipment and receiver.

Connect the equipment into an outlet on a circuit different from that to which the receiver is needed.

Consult the dealer or an experienced radio/TV technician for help.

Warning: Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

The user's manual or instruction manual for an intentional or unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

CAUTION:

- 1. To comply with FCC RF exposure compliance requirements, a separation distance of at least 20 cm must be maintained between the antenna of this device and all persons.
- 2. This Transmitter must not be co-located or operating in conjunction with any other antenna or transmitter

Chapter 1: Introduction

The **802.11n 3G Router with USB2.0 Port** is a draft 802.11n/b/g compliant Wireless Broadband Router with 4-port Fast Ethernet Switch. **802.11n 3G Router with USB2.0 Port** with latest Draft 802.11n technology that delivers up to 150Mbps wireless, provides multi-functional capabilities, particularly the high-performance throughput and high-quality security to propose an integrated, thorough SOHO solution. The incredible speed of **802.11n 3G Router with USB2.0 Port** makes it ideal for media-centric applications like streaming video, gaming, and Voice over IP technology, ensure optimum performance and maximum coverage with an external antenna. With the 3G Router, government employees or corporate users can create a wireless network and provide colleagues with remote access to their secure private networks. By installing the 3G Router on a bus, train, or even a boat, you can allow passengers to check e-mail or chat online while commuting.

Features

- Support the IEEE 802.11n/b/g standard, high speed date rate up to 150Mbps
- Support WPS (Wi-Fi Protected Setup) with reset button
- High security with build-in Security: WEP 64/128, WPA-PSK, WPA-2PSK, WPA, WPA2, 802.1x and 802.11i
- Support Gateway, WDS (Bridge + Repeater)
- Support USB 3.5G (HSDPA) device
- Easy configuration for home user setup

Physical Details

Front LEDs

LED Behavior						
LED	Printed Color Behavior Indication					
Power	Power	Green	ON	Power on		

			OFF	Power off	
			OFF	WLAN function off	
WLAN	WLAN/	Green	ON	WLAN link / WPS function active	
WPS	WPS		Blinking	WLAN traffic transmitting	
		Orange	Blinking	WPS is enabled to make a connection	
			ON	WAN link / active	
WAN	WAN	Green	OFF	WAN function off	
			Blinking	WAN traffic transmitting	
	1 2 3 4 4 Green	1	1 2 3 LAN 3 Green	OFF	LAN function off
LAN 1~4				ON	LAN link / active
		Blinking	LAN traffic transmitting		

Rear Panel

WPS	To enable the WPS function via web configuration (Wireless > WPS), then press the WPS button once on the Wireless Router, the WPS LED will start to flash. To make a connection with other WPS supported device within 3 minutes.
RESET	Keep on pressing the Reset button more than 3 seconds, the Wireless Router will set all setting back to factory default values.
LAN 1~4	Use standard LAN cables (RJ45 connectors) to connect your PCs to the port. If required, any port can be connected to another hub. Any LAN port will automatically function as an "Uplink" port when necessary.
WAN	Connect the ADSL or Cable Modem here with RJ45 cable. If your modem came with a cable, use the supplied cable, otherwise, use a standard LAN cable.
POWER	Connect the power supply adapter here.

Side Panel

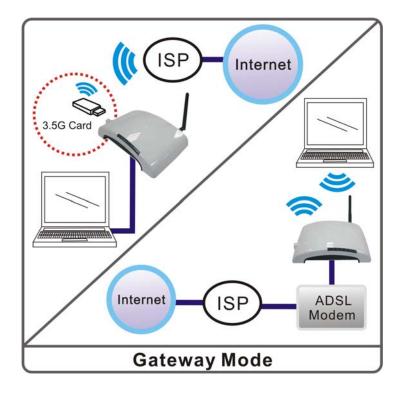

Chapter 2: About Operation Modes

Please go to the **Wireless**> **WDS** to set up the WDS function (Bridge or Repeater) of the Wireless Router.

Gateway Mode

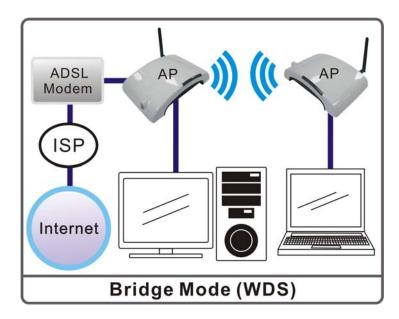

The wireless connection will be set up from a point-to-point local LAN into a point-to-multipoint WAN. This device connects all the stations (PC/notebook with wireless function) to a wireless network. All stations can have the Internet access if only the device has the Internet connection.

Bridge (WDS) Mode

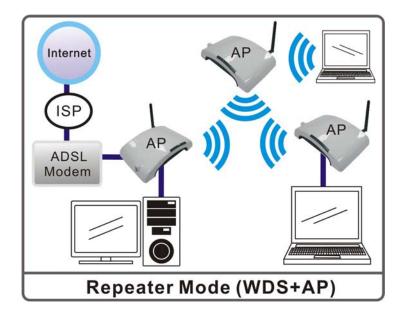

The WDS (Wireless Distributed System) function lets this access point act as a wireless LAN access point and repeater at the same time. Users can use this feature to build up a large wireless network in a large space like airports, hotels and schools and so on. This feature is also useful when users want to bridge networks between buildings where it is impossible to deploy network cable connections between these buildings.

In this mode, all Ethernet ports and wireless interface are bridge together and NAT function is disabled. All the WAN related function and firewall are not supported. Wireless Distribution System uses wireless media to communicate with other APs, like the Ethernet does. To do this, you must set these APs in the same **channel** and **wireless MAC address** to each other APs that you want to communicate with.

Repeater (WDS+AP) Mode

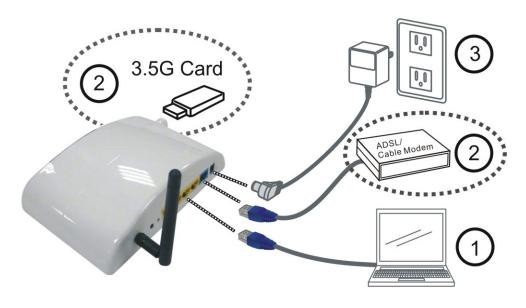

If set to Repeater mode, a device connects to each other through an access point or a base station (gateway or router.) This device can also work like a wireless station when it's connected to a computer directly, so that the computer can send packets from wired end to wireless interface.

Chapter 3: Configuration

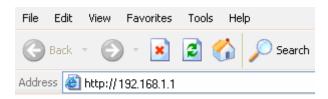

Hardware Connection

- 1. Connect one end of the Ethernet cable to the LAN port of the Wireless Router, another end to your PC or notebook.
- 2. There are two connection methods to connect to Internet (Only one can be selected):
 - Connect Ethernet cable one end to the WAN port of the Wireless Router, the other end to the ADSL or cable modem.
 - > Or you can insert USB 3.5G card (that provide by your ISP) into USB port.
- 3. Finally, connect the Wireless Router with a power to an outlet.

Login

- 1. Start your computer and make sure the connection by an Ethernet cable between your computer and the Wireless Router.
- 2. Start your Web Browser.
- In the Address box, enter the IP address of the Wireless Router, as in this example, which uses the Wireless Router's default IP address: <u>http://192.168.1.1</u>

4. After connected successfully, the following screen will show up. Simply enter the username "admin" and password "password" to login.

Connect to 192.1	68.1.1 ? 🔀

If you cannot connect...

If the Wireless Router does not respond, check the following:

- The Wireless Router is properly installed, LAN connection is OK, and it is powered ON. You can test the connection by using the "Ping" command:
 - Please go to **Start>Run...>** Enter "**cmd**" command in the column to open the MS-DOS window.

If no response is received, either the connection is not working, or your PC's IP address is not compatible with the Wireless Router's IP Address. (See next item.)

- If your PC is using a fixed IP Address, its IP Address must be within the range 192.168.1.2 to 192.168.1.254 to be compatible with the Wireless Router's default IP Address of 192.168.1.1. Also, the Network *Mask* must be set to 255.255.255.0. See <u>Chapter 4 PC Configuration</u> for details on checking your PC's TCP/IP settings.
- Ensure that your PC and the Wireless Router are on the same network segment. (If you don't have a router, this must be the case.)
- Ensure you are using the wired LAN interface. The Wireless interface can only be used if its configuration matches your PC's wireless settings.

Common Connection Types

The Internet connection type according to the ISP (Internet Service Provider) that you selected.

Cable Modems

Туре	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	Usually, none. However, some ISP's may require you to use a particular Hostname, Domain name, or MAC (physical) address.
Static (Fixed) IP Address	Your ISP allocates a permanent IP Address to you.	IP Address allocated to you. Some ISP's may also require you to use a particular Hostname, Domain name, or MAC (physical) address.

DSL Modems

Туре	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	None.
Static (Fixed) IP Address	Your ISP allocates a permanent IP Address to you.	IP Address allocated to you.
PPPoE	You connect to the ISP only when required. The IP address is usually allocated automatically.	User name and password.

Other Modems (e.g. 3.5G Wireless card)

Туре	Details	ISP Data required
Dynamic IP Address	Your IP Address is allocated automatically, when you connect to you ISP.	The ISP's may require you to use a particular Hostname, Domain name, or MAC (physical) address.

Setup Wizard

Step 1- WAN Connect Detection

This page is used to detect the WAN connection of network. User can select **Auto Detect** form the pull-down menu and click **Start Auto Detect** button, the system will detect whether there is WAN connection or not. If user wants to set up the WAN detection manually, please select **Manual** form the pull-down menu, then click **Next** to continue.

WAN Detection

Start Auto Detect

Detect Result

Next >>

Select	To use the WAN detect function, user can select Manual or Auto Detect form the pull-down menu.		
WAN Detection	Select Auto Detect form the pull-down menu and click Start Auto Detect button, the detecting screen will be pop-up to detect whether there is WAN connection or not. If user wants to set up the WAN detection manually, please select Manual form the pull-down menu, then click Next to continue.		
Detect Result	Here shows the WAN detection result. If there is no WAN connection, the system will show NONE or Unplugged Cable .		

Step 2- WAN Access Type

Here user can set up the WAN connection type easily. Select the WAN Connection Type **Static (Fixed IP), DHCP (Auto Config), PPPoE(ADSL),** or **3G (DIAL)** and click **Next** to continue.

	WAN Connection Type	DHCP (Auto Config) 😒
	Cancel << Back	Next >>

Dial Number: Enter the dial number that the ISP provided.
Operation Mode : Select Keep Alive , On Demand or Manual form the pull- down list.
• Keep Alive Mode: Enter the Redial Period seconds in the box.
• On demand Mode: Enter the Idle Time minutes in the box.
• MTU Value: MTU (Maximum Transmission Unit, namely the maximum packet size, the default value is 1452) for your application. Reducing the packet size can help connecting to certain web sites or speeding up packet transfer rate. If the incorrect selection is entered, you may not be able to open certain web sites.

Step 3- LAN

This step can set up local area network of the Wireless Router, such as IP address, subnet mask, DHCP type, DHCP IP addresses range, DHCP subnet mask and DHCP lease time.

IP Address	192.168.1.1	
Subnet Mask	255.255.255.0	
DHCP Туре	Server 💌	
Start IP Address	192.168.1.100	
End IP Address	192.168.1.200	
Subnet Mask	255.255.255.0	
Primary DNS Server	192.168.1.1	
Secondary DNS Server	0.0.0	
Default Gateway	192.168.1.1	
Lease Time	86400	seconds
Cancel << Back Ne	ext >>	

IP Address	Shows the IP address of the Wireless Router (Default IP address is 192.168.1.1.)
Subnet Mask	The subnet mask of the Wireless Router (Default subnet mask is 255.255.255.0.)
DHCP Туре	Disable: Select to disable this Wireless Router to distribute IP addresses to connected clients.Server: Select to enable this Wireless Router to distribute IP Addresses (DHCP Server) to connected clients. And the following field will be
Start IP Address	activated for you to enter the starting IP Address. The starting address of this local IP network address pool. The pool is a piece of continuous IP address segment. Keep the default value

	192.168.1.100 should work for most cases.
End IP Address	The end IP address, the maximum is 254. If " Start IP Address " is set at 192.168.1.100 and the " End IP address " is 192.168.1.200, the device will distribute IP addresses from 192.168.1.100 to 192.168.1.200 to all the computers in the network that request IP addresses from DHCP server (Router).
Subnet Mask	The subnet mask of the distribute IP addresses clients, the subnet mask must be set at the same segment as the Wireless Router.
Primary DNS Server Secondary DNS Server	The DNS should be set to the address provided by your ISP.
Default Gateway	Enter the default gateway IP address provided by your ISP in this column.
Lease Time	The lease time of the distribute IP Addresses. Default settings are 86400 seconds.

Step 4- Network Mode

This step can set up wireless network mode, network name and channel.

Network Mode	11b/g/n mixed mode ⊻
Network Name(SSID)	3G_Router
Frequency (Channel)	AutoSelect 💌
Cancel << Back	Next >>

Network Mode	Select 11b/g mixed mode, 11b only, 11g only, or 11b/g/n mixed mode from the pull-down menu. (Default is 11b/g/n mixed mode.)
Network Name (SSID)	A SSID is referred to a network name because essentially it is a name (case-sensitive) that identifies a wireless network.
Frequency (Channel)	Select 1~11 or Auto Select from the pull-down menu.

Step 5- Security

Here can set up the wireless security of the Wireless Router.

Security N	lode	Disable	*
Cancel	< Back	Finished	

Select desired security type from the pull-down menu **Disable**, **Open System**, **Shared Key**, **AUTO(Open/Shared)**, **WPA-PSK**, **WPA2-PSK**, and **WPA-PSK/WPA2-PSK**. The default setting is Disable. It is strongly recommended to set up security mode (Open, Shared, AUTO(Open/Shared), WPA-PSK, WPA2-PSK, WPA-PSK/WPA2-PSK) to prevent any unauthorized accessing.

Security Mode	Open System	*

IP: Enter the fixed IP address that DHCP Server assigned to a certain connected station. User can set up 3 set of fixed IP addresses that distribute form the Wireless Router when the DHCP Type function be selected to Server.
UPNP	Universal Plug and Play (UPnP) is a set of computer protocols promulgated by the UPnP Forum. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. UPnP achieves this by defining and publishing UPnP device control protocols built upon open, Internet-based communication standards. The term UPnP is derived from plug-and-play, a technology for dynamically attaching devices directly to a computer.
	Select Disable or Enable from the pull-down menu.
PPPoE Relay	Select Disable or Enable from the pull-down menu.

DHCP Clients

Here shows the IP assigned clients that computer in the network requests IP addresses from DHCP server (Wireless Router).

DHCP Client List

You could monitor DHCP clients here.

MAC Address	IP Address	Expires In
00:00:00:00:00	192.168.1.100	00:59:41
00:12:0E:9A:A1:D9	192.168.1.101	23:59:44

Advanced Routing

If you connect several routers with this Wireless Router, you may need to set up a predefined routing rule to have more effective network topology/traffic, this is called static route between those routers and the Wireless Router.

To set static routers, enter the settings including route IP address, route mask route gateway the route Interface from LAN or WAN.

Contraction of the second			
Static	Rout	10 51	ennos
and the second s	on a subul		

You may add and remote custom Internet routing rules, and/or enable dynamic routing exchange protocol here.

BSSID	00:0C:43:41:88:44
Frequency (Channel)	AutoSelect
HT Physical Mode	
Channel BandWidth	○20
Guard Interval	O Long Auto
MCS	Auto 😒
Decline BA Request	Oisable ○ Enable

Radio On/Off	Click Radio ON/OFF button to turn on or off the radio function.	
Network Mode	Select 11b/g mixed, 11b only, 11g only, or 11b/g/n mixed mode from the pull-down menu. (Default is 11b/g/n mixed mode.)	
Network Name (SSID)	A SSID is referred to a network name because essentially it is a name that identifies a wireless network (case-sensitive).	

Multiple SSID 1~3	A multiple SSID is referred to a network name because essentially it is a name that identifies a wireless network.	
Broadcast Network Name(SSID)	Enable: This wireless AP will broadcast its SSID to stations.Disable: This wireless AP will not broadcast its SSID to stations. If stations want to connect to this wireless AP, this AP's SSID should be known in advance to make a connection.	
AP Isolation	Select Enable or Disable to enable this function.	
MBSSID AP Isolation	Select Enable or Disable to enable this function.	
BSSID	Shows the MAC address of the Wireless Router.	
Frequency (Channel)	Select 1~11 or Auto Select from the pull-down menu.	
HT Physical Mode		
Channel Band Width	Select 20 or 20/40. (Default setting is 20/40.)	
Guard Interval	Select Long or Auto. (Default setting is Auto.)	
MCS	Select form the pull-down menu 0~7 or Auto. (Default setting is Auto.)	
Decline BA Request	Select Disable or Enable. (Default setting is Disable.)	

Security

Wireless Security/Encryption Settings

Setup the wireless security and encryption to prevent from unauthorized access and monitoring.

Wireless Security/Encryption Settings		
SSID Choice	Select SSID to set up the security form the pull-down list.	
Security Mode	There are eleven type of authentication modes including Disable , Open System , Shared Key , AUTO(Open/Shared) , WPA , WPA-PSK , WPA2 , WPA2-PSK , WPA-PSK/WPA2-PSK , WPA1/WPA2 and 802.1X . The security default setting is Disable.	
	 Note: > WPA and WPA-PSK only support TKIP and AES as encryption method > Shared Key only supports WEP as encryption method. > AUTO(Open/Shared) means AP can accept STA connect to it using OPEN-WEP or SHARED-WEP. 	
	Open System/AUTO(Open/Shared)	
	If your wireless router is using Open System or AUTO(Open/Shared) authentication, then the wireless adapter will need to be set to the same authentication type.	

Security Mode	AUTO(Open/Shared) 😒	
Wire Equivalence Pi	otection (WEP)	
Default Key	Key 1 🐱	
WEP Key should be a 1	0/26 hexadecimal or a 5/13 character.	
WEP Key 1		Hex 🗸
WEP Key 2		Hex 💌
		Hex 👻
WEP Key 3		

Default Key: Select the default key.

WEP Key 1~4: Enter the key in the selected key field. Only valid when using WEP encryption algorithm. The key must match with the AP's key. There are several formats to enter the keys.

- Hexadecimal (WEP 64 bits): 10 Hex characters (0~9, a~f).
- Hexadecimal (WEP 128 bits): 26 Hex characters (0~9, a~f).
- ASCII (WEP 64 bits): 5 ASCII characters (case-sensitive).
- ASCII (WEP 128 bits): 13 ASCII characters (case-sensitive).

Shared Key

Shared key is when both the sender and the recipient share a secret key.

"Cherry"		
Security Mode	Shared key 💉

WPA	
WPA Algorithms	OTKIP OAES OTKIPAES
Key Renewal Interval	3600 seconds
IP Address	
Port	1812
Shared Secret	
Shared Secret Session Timeout	

Key Renewal Interval: Enter the renewal security time (seconds) in the column. Default is 3600 seconds. Set 0 to disable re-key.

RADIUS Server: RADIUS is an authentication, authorization and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information.

IP Address: Enter the RADIUS Server's IP Address provided by your ISP.

Port: Enter the RADIUS Server's port number provided by your ISP. (The default is **1812**.)

Shared Secret: Enter the password that the Wireless Router shares with the RADIUS Server.

Session Timeout: Session timeout interval is for 802.1x re-authentication setting. Set to zero to disable 802.1x re-authentication service for each session. Session timeout interval unit is second and must be larger than 60.

Idle Timeout: Enter the idle timeout in the column.

- * **PMK Cache Period:** <u>Only valid in WPA2 security</u>. Set WPA2 PMKID cache timeout period, after time out, the cached key will be deleted. PMK Cache Period unit is minute.
- * **Pre-Authentication**: <u>Only valid in WPA2 security</u>. The most important features beyond WPA to become standardized through 802.11i/WPA2 are: pre-authentication, which enables secure fast roaming without noticeable signal latency.

Add a station Mac	Enter a station MAC in the blank field. The maximum rule count is 8.

WDS

Making a connection between access points by using WDS function, please follow below steps.

- The APs must support WDS function. (To set WDS must use the same wireless product (the same model will be better); due to different wireless products might support different WDS settings. Thus, it is suggested to use the same wireless products that support WDS function.)
- 2. To set the same **SSID** on the APs.
- 3. To set the same **channel** on the APs.
- 4. To set the same Wireless MAC address(BSSID) on the APs.
- 5. To set same **security** (WEP or WPA) on the APs.

Administrator Settings				
Account	Key in a new login user name in the blank field.			
Password	Maximum input is 36 alphanumeric characters (case-sensitive.)			
NTP Settings				
Current Time	Click Sync with host button to synchronize the time with the host PC.			
Time Zone	Select the time zone area that you located from the pull-down list.			
NTP Server	Enter the Network Time Protocol Server here. Ex: time.nist.gov, ntp0.broad.mit.edu, or time.stdtime.gov.tw.			
NTP synchronization	The device will synchronize time with the server according to the hour(s) that entered.			
Green AP				
Duration	After the Action (WiFi TX power) be enabled, then the duration time can be set up. Set up a period of time to enable or disable the wireless TX function.			
Action	Select Disable, WiFi TX power OFF, WiFi TX power 25%, WiFi TX power 50%, or WiFi TX power 75% from the pull-down menu, to enable or disable the wireless TX function of the Wireless Router.			
DDNS Settings				
Dynamic DNS Provider	Select the DNS provider form the pull-down list. DNS provider is a company that provides access to the internet.			
Account	Enter your account that registered in DNS provider website.			
Password	Enter passwords that registered.			
DDNS	Apply for a Domain Name, and ensure it is allocated to you.			
Result	Here shows the DDNS status.			

Upload Firmware

Upgrade Firmware

Upgrade the system firmware to obtain new functionality.

Update Firmware	
Location Apply	Browse
Update Firmware	
Location	Click the Browse button, find and open the firmware file (the browser will display to correct file path) then click Apply to upgrade the Wireless Router's firmware.
	Notice! <u>Please DO NOT power OFF the Wireless Router</u> while upgrading firmware.

Reboot

Click the **Reboot** button to restart the Wireless Router.

System Reboot

The page will reboot system by user.

Reboot

Chapter 4: PC Configuration

Overview

For each PC, the following may need to be configured:

- TCP/IP network settings
- Internet Access configuration
- Wireless configuration

Windows Clients

- This section describes how to configure Windows clients for Internet access via the Wireless Router.
- The first step is to check the PC's TCP/IP settings.
- The Wireless Router uses the TCP/IP network protocol for all functions, so it is essential that the TCP/IP protocol be installed and configured on each PC.

TCP/IP Settings - Overview

If using default Wireless Router settings, and default Windows TCP/IP settings, no changes need to be made.

- By default, the Wireless Router will act as a DHCP Server, automatically providing a suitable IP Address (and related information) to each PC when the PC boots.
- For all non-Server versions of Windows, the default TCP/IP setting is to act as a DHCP client.

If using a Fixed (specified) IP address, the following changes are required:

- The *Gateway* must be set to the IP address of the Wireless Router.
- The *DNS* should be set to the address provided by your ISP.

Checking TCP/IP Settings - Windows 2000

- 1. Select Control Panel Network and Dial-up Connection.
- 2. Right click the *Local Area Connection* icon and select *Properties*. You should see a screen like the following:

.ocal Area Connection Properties ? 🗙
General
Connect using:
B SMC EZ Card 10/100 (SMC1211TX)
, Configure
Components checked are used by this connection:
Client for Microsoft Networks Silver Sharing for Microsoft Networks Internet Protocol (TCP/IP)
Install Uninstall Properties
Description
Transmission Control Protocol/Internet Protocol. The default wide area network protocol that provides communication across diverse interconnected networks.
Show icon in taskbar when connected
OK Cancel

- 3. Select the *TCP/IP* protocol for your network card.
- 4. Click on the *Properties* button. You should then see a screen like the following.

eneral	
	d automatically if your network supports eed to ask your network administrator for
Obtain an IP address auto	matically
O Use the following IP address	
IP address:	
Subnet mask:	
Default gateway:	· · · · ·
 Obtain DNS server addres 	s automatically
- O Use the following DNS se	rver addresses:
Preferred DNS server:	
Alternate DNS server:	
	Advanced
	OK Cano

5. Ensure your TCP/IP settings are correct, as described below.

Using DHCP

- To use DHCP, select the radio button *Obtain an IP Address automatically*. This is the default Windows setting. Using this is recommended. By default, the Wireless Router will act as a DHCP Server.
- Restart your PC to ensure it obtains an IP Address from the Wireless Router.

Using a fixed IP Address ("Use the following IP Address")

If your PC is already configured, check with your network administrator before making the following changes.

• Enter the Wireless Router 's IP address in the *Default gateway* field and click *OK*. (Your LAN administrator can advise you of the IP Address they assigned to the Wireless Router.)

• If the *DNS Server* fields are empty, select *Use the following DNS server addresses*, and enters the DNS address or addresses provided by your ISP, then click *OK*.

Checking TCP/IP Settings - Windows XP

- 1. Select Control Panel Network Connection.
- 2. Right click the *Local Area Connection* and choose *Properties*. You should see a screen like the following:

🕹 Local Area Connection Properties 🛛 🕐	×
General Authentication Advanced	
Connect using:	
D-Link DFE-530TX PCI Fast Ethernet Adapter (rev.B)]
Configure	
This connection uses the following items:	
 ✓ Internet for Microsoft Networks ✓ Internet Protocol (TCP/IP) 	
Install Uninstall Properties	J
Description Transmission Control Protocol/Internet Protocol. The default wide area network protocol that provides communication across diverse interconnected networks.	
Show icon in notification area when connected	
OK Cancel	

- 3. Select the *TCP/IP* protocol for your network card.
- 4. Click on the *Properties* button. You should then see a screen like the following.

eneral	Alternate Configu	ration						
his capa	get IP settings as ability. Otherwise, opriate IP settings	you nee						
<u>о</u> ь	tain an IP addres:	s autom	atically	1				
	e the following IP	address	s:

-O Us	e the following DN	IS servi	er addi	esses: –				
Prefe	red DNS server:				1	1]
Altern	ate DNS server:]
							Ad <u>v</u> ar	nced

5. Ensure your TCP/IP settings are correct.

Using DHCP

- To use DHCP, select the radio button *Obtain an IP Address automatically*. This is the default Windows setting. Using this is recommended. By default, the Wireless Router will act as a DHCP Server.
- Restart your PC to ensure it obtains an IP Address from the Wireless Router.

Using a fixed IP Address ("Use the following IP Address")

If your PC is already configured, check with your network administrator before making the following changes.

- In the *Default gateway* field, enter the Wireless Router 's IP address and click *OK*. Your LAN administrator can advise you of the IP Address they assigned to the Wireless Router.
- If the *DNS Server* fields are empty, select *Use the following DNS server addresses*, and enters the DNS address or addresses provided by your ISP, then click *OK*.

Internet Access

To configure your PCs to use the Wireless Router for Internet access:

- Ensure that the ADSL modem, DSL modem, Cable modem, or other permanent connection is functional.
- Use the following procedure to configure your Browser to access the Internet via the LAN, rather than by a Dial-up connection.

For Windows 2000

- 1. Select Start Menu Settings Control Panel Internet Options.
- 2. Select the Connection tab, and click the Setup button.
- 3. Select "I want to set up my Internet connection manually, or I want to connect through a local area network (LAN)" and click *Next*.
- 4. Select "I connect through a local area network (LAN)" and click *Next*.
- 5. Ensure all of the boxes on the following Local area network Internet Configuration screen are unchecked.
- 6. Check the "No" option when prompted "Do you want to set up an Internet mail account now?"
- 7. Click *Finish* to close the Internet Connection Wizard. Setup is now completed.

For Windows XP

- 1. Select Start Menu Control Panel Network and Internet Connections.
- 2. Select Set up or change your Internet Connection.
- 3. Select the *Connection* tab, and click the *Setup* button.
- 4. Cancel the pop-up "Location Information" screen.
- 5. Click *Next* on the "New Connection Wizard" screen.
- 6. Select "Connect to the Internet" and click Next.
- 7. Select "Set up my connection manually" and click *Next*.
- 8. Check "Connect using a broadband connection that is always on" and click Next.
- 9. Click Finish to close the New Connection Wizard. Setup is now completed.

Accessing AOL

To access AOL (America On Line) through the Wireless Router, the *AOL for Windows* software must be configured to use TCP/IP network access, rather than a dial-up connection. The configuration process is as follows:

- 1. Start the *AOL for Windows* communication software. Ensure that it is Version 2.5, 3.0 or later. This procedure will not work with earlier versions.
- 2. Click the *Setup* button.
- 3. Select *Create Location*, and change the location name from "New Locality" to " Wireless Router ".
- 4. Click *Edit Location*. Select *TCP/IP* for the *Network* field. (Leave the *Phone Number* blank.)
- 5. Click *Save*, then *OK*.
- 6. Configuration is now complete.
- 7. Before clicking "Sign On", always ensure that you are using the "Wireless Router " location.

Macintosh Clients

From your Macintosh, you can access the Internet via the Wireless Router. The procedure is as follows. 1. Open the TCP/IP Control Panel.

- 2. Select *Ethernet* from the *Connect via* pop-up menu.
- 3. Select *Using DHCP Server* from the *Configure* pop-up menu. The DHCP Client ID field can be left blank.
- 4. Close the TCP/IP panel, saving your settings.

Note:

If using manually assigned IP addresses instead of DHCP, the required changes are:

- Set the *Router Address* field to the Wireless Router 's IP Address.
- Ensure your DNS settings are correct.

Linux Clients

To access the Internet via the Wireless Router, it is only necessary to set the Wireless Router as the "Gateway".

Ensure you are logged in as "root" before attempting any changes.

Fixed IP Address

By default, most Unix installations use a fixed IP Address. If you wish to continue using a fixed IP Address, make the following changes to your configuration.

- Set your "Default Gateway" to the IP Address of the Wireless Router.
- Ensure your DNS (Domain Name server) settings are correct.

To act as a DHCP Client (Recommended)

The procedure below may vary according to your version of Linux and X -windows shell.

- 1. Start your X Windows client.
- 2. Select Control Panel Network.
- 3. Select the "Interface" entry for your Network card. Normally, this will be called "eth0".
- 4. Click the *Edit* button, set the "protocol" to "DHCP", and save this data.
- 5. To apply your changes:
 - Use the "Deactivate" and "Activate" buttons, if available.

• OR, restart your system.

Other Unix Systems

To access the Internet via the Wireless Router:

- Ensure the "Gateway" field for your network card is set to the IP Address of the Wireless Router.
- Ensure your DNS (Name Server) settings are correct.

Wireless Station Configuration

• This section applies to all wireless stations wishing to use the Wireless Router 's access point, regardless of the operating system that is used on the client.

Mode	The mode must be set to Infrastructure.		
SSID (ESSID)	The network name must match the value used on the Wireless Router. <i>Note! The SSID is case sensitive.</i>		
Open System Shared Key	If there is no security is enabled on the Wireless Router, the security of each station should be disabled as well. And, you can connect the Wireless Router without security, but it is NOT recommended.		
	By default, WEP on the Wireless Router is disabled.		
AUTO(Open/Shared)	• If WEP remains disabled on the Wireless Router, all stations must have WEP disabled.		
	• If WEP is enabled on the Wireless Router, each station must use the same settings as the Wireless Router.		
WPA-PSK WPA2-PSK WPA-PSK WPA2-PSK	WPA-PSK (TKIP/AES)/ WPA2-PSK (TKIP/AES)/ WPA-RADIUS (TKIP/AES)/ WPA2 -RADIUS (TKIP/AES): If one of these securities is enabled on the Wireless Router. To make a connection, each station must use the same algorithms and pass phrase as the Wireless Router.		
WPA WPA2 WPA WPA2 802.1x	RADIUS Server: RADIUS is an authentication, authorization and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information. Each station must set up the RADIUS Server's IP address, port and passwords that provided by your ISP.		

• To use the Wireless Router, each wireless station must have compatible settings, as following:

Note: By default, the Wireless Router will allow 802.11b, 802.11g and 802.11n connections.

Appendix A: Troubleshooting

Overview

This chapter covers some common problems that may be encountered while using the Wireless Router and some possible solutions to them. If you follow the suggested steps and the Wireless Router still does not function properly, contact your dealer for further advice.

General Problems

Problem 1:	Can't connect to the Wireless Router to configure it.
Solution 1:	Check the following:
	• Check the Wireless Router is properly installed, LAN connections are OK, and it is powered ON.
	• Ensure that your PC and the Wireless Router are on the same network segment.
	• If your PC is set to "Obtain an IP Address automatically" (DHCP client), please restart it.
	 If your PC uses a Fixed (Static) IP address, ensure that it is using an IP Address within the range 192.168.1.2 to 192.168.1.254 and thus compatible with the Wireless Router's default IP Address of 192.168.1.1. Also, the Network Mask should be set to 255.255.255.0 to match the Wireless Router. In Windows, you can check these settings by using <i>Control Panel-Network</i> to check the <i>Properties</i> for the TCP/IP protocol.

Internet Access

Problem 1:	When I enter a URL or IP address I get a time out error.
Solution 1:	A number of things could be causing this. Try the following troubleshooting steps.
	• Check if other PCs work. If they do, ensure that your PCs IP settings are correct. If using a Fixed (Static) IP Address, check the Network Mask, Default gateway and DNS as well as the IP Address.
	• If the PCs are configured correctly, but still not working, check the Wireless Router. Ensure that it is connected and ON. Connect to it and check its settings. (If you can't connect to it, check the LAN and power connections.)

	• If the Wireless Router is configured correctly, check your Internet connection (DSL/Cable modem etc) to see that it is working correctly.
Problem 2:	Some applications do not run properly when using the Wireless Router.
Solution 2:	The Wireless Router processes the data passing through it, so it is not transparent.
	Use the <i>Content Filter Settings</i> feature to allow the use of Internet applications, which do not function correctly.
	If this does solve the problem you can use the <i>DMZ</i> function. This should work with almost every application, but:
	• It is a security risk, since the firewall is disabled.
	• Only one (1) PC can use this feature.

Wireless Access

Problem 1:	My PC can't locate the Wireless Router.	
Solution 1:		
Solution 1.	Check the following:	
	• Your PC is set to <i>Infrastructure Mode</i> . (Access Points are always in <i>Infrastructure Mode</i>)	
	• The SSID on your PC and the Wireless Router are the same. Remember that the SSID is case-sensitive. So, for example " <u>W</u> orkgroup" does NOT match " <u>w</u> orkgroup."	
	• Both your PC and the Wireless Router must have the same setting for security. The default setting for the Wireless Router security is disabled, so your wireless station should also have security disabled.	
	• If security is enabled on the Wireless Router, your PC must have security enabled, and the key must be matched.	
	• To see if radio interference is causing a problem, see if connection is possible when close to the Wireless Router. Remember that the connection range can be as little as 100 feet in poor environments.	
Problem 2:	Wireless connection speed is very slow.	
Solution 2:	The wireless system will connect at the highest possible speed, depending on the distance and the environment. To obtain the highest possible connection speed, you can experiment with the following:	
	• Wireless Router location Try adjusting the location and orientation of the Wireless Router.	
	• Wireless Channel If interference is the problem, changing to another channel may show a marked improvement.	
	• Radio Interference Other devices may be causing interference. You can experiment by switching other devices off, and see if this helps. Any "noisy" devices should be shielded or relocated.	

	• RF Shielding Your environment may tend to block transmission between the wireless stations. This will mean high access speed is only possible when close to the Wireless Router.
--	---

Appendix B: About Wireless LANs

BSS

A group of Wireless Stations and a single Access Point, all using the same ID (SSID), form a Basic Service Set (BSS).

Using the same SSID is essential. Devices with different SSIDs are unable to communicate with each other.

Channels

The Wireless Channel sets the radio frequency used for communication.

- Access Points use a fixed Channel. You can select the Channel used. This allows you to choose a Channel which provides the least interference and best performance. In the USA and Canada, 11 channel are available. If using multiple Access Points, it is better if adjacent Access Points use different Channels to reduce interference.
- In "Infrastructure" mode, Wireless Stations normally scan all Channels, looking for an Access Point. If more than one Access Point can be used, the one with the strongest signal is used. (This can only happen within an ESS.)

Note to US model owner: To comply with US FCC regulation, the country selection function has been completely removed from all US models. The above function is for non-US models only.

Security WEP

WEP (Wired Equivalent Privacy) is a standard for encrypting data before it is transmitted. This is desirable because it is impossible to prevent snoopers from receiving any data which is transmitted by your Wireless Stations. But if the data is encrypted, then it is meaningless unless the receiver can decrypt it.

If WEP is used, the Wireless Stations and the Access Point must have the same security settings for each of the following:

WEP	64 Bits, 128 Bits.
Key	For 64 Bits encryption, the Key value must match. For 128 Bits encryption, the Key value must match.
WEP Authentication	Open System or Shared Key.

WPA/WPA2

WPA/WPA2 (Wi-Fi Protected Access) is more secure than WEP. It uses a "Shared Key" which allows the encryption keys to be regenerated at a specified interval. There are several encryption options: **TKIP, AES, TKIP-AES** and additional setup for **RADIUS** is required in this method. The most important features beyond WPA to become standardized through 802.11i/WPA2 are: pre-authentication, which enables secure fast roaming without noticeable signal latency.

If WPA or WPA2 is used, the Wireless Stations and the Access Point must have the same security settings.

WPA-PSK/ WPA2-PSK

WPA/WPA2 (Wi-Fi Protected Access using Pre-Shared Key) is recommended for users who are not using a RADIUS server in a home environment and all their clients support WPA/WPA2. This method provides a better security.

If WPA-PSK or WPA2-PSK is used, the Wireless Stations and the Access Point must have the same security settings.

Encryption	WEP Key 1~4	Passphrase
TKIP		
AES	NOT REQUIRED	8-63 characters

802.1x

With **802.1x** authentication, a wireless PC can join any network and receive any messages that are not encrypted, however, additional setup for **RADIUS** to issue the WEP key dynamically will be required. RADIUS is an authentication, authorization, and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information.

Wireless LAN Configuration

To allow Wireless Stations to use the Access Point, the Wireless Stations and the Access Point must use the same settings, as follows:

Mode	The mode must be set to Infrastructure.	
SSID (ESSID)	The network name must match the value used on the Wireless Router. <i>Note! The SSID is case sensitive.</i>	
Open System Shared Key	If there is no security is enabled on the Wireless Router, the security of each station should be disabled as well. And, you can connect the Wireless Router without security, but it is NOT recommended.	
AUTO(Open/Shared)	 By default, WEP on the Wireless Router is disabled. If WEP remains disabled on the Wireless Router, all stations must have WEP disabled. If WEP is enabled on the Wireless Router, each station must use the same settings as the Wireless Router. 	
WPA-PSK WPA2-PSK	WPA-PSK (TKIP/AES)/ WPA2-PSK (TKIP/AES: If one of these	

WPA-PSK WPA2-PSK	securities is enabled on the Wireless Router. To make a connection, each station must use the same algorithms and pass phrase as the Wireless Router.
WPA WPA2 WPA WPA2 802.1x	RADIUS Server: RADIUS is an authentication, authorization and accounting client-server protocol. The client is a Network Access Server that desires to authenticate its links. The server is a server that has access to a user database with authentication information. Each station must set up the RADIUS Server's IP address, port and passwords that provided by your ISP.
